

Overview

The Alliance AL-1801 computer/printer interface connects the Alliance control panel with a personal computer and/or printer through serial interface cables so that the user can view or print real-time reports and events stored in Alliance control panel memory.

The AL-1801 computer and printer interface board mounts on the Alliance control panel and uses serial interface cables to connect to a computer and/or printer.

The AL-1801 computer interface allows Alliance Enterprise or Professional software to connect to the Alliance control panel. The computer port requires that a computer address be programmed in the Alliance system programming menu.

The AL-1801 printer port can be programmed to provide real-time printer output, or to print history alarm events stored in memory. Baud rate and data format options can also be selected.

Features

- Connect Alliance control panel to a computer or printer
- Program printer interfaces to provide real-time output
